

Installation guide for Windows devices

Using your browser of choice, select the download link for the SSL Certificate from the splash page (if you are on the “New-Devices-Connect-Here-First” wireless network) or manually browse to <http://cert.isd186.org> and click the download link for the SSL Certificate. Run the downloaded certificate file and follow the images below to install it on your Windows device.

Now that you have the SSL certificate installed on your Windows device you can safely browse any SSL enabled websites. If you were using the special wireless network to get the certificate, you can now connect to any ISD186 wireless network to begin browsing normally.
